Assessment Part 1

Develop an API Endpoint

1. Create an IAM role named **coupons_lambda_role** in **localstack**.
2. The permissions assigned to the **coupons_lambda_role** role that will be associated with the lambda functions in the API should allow access to the following services **Cloudwatch**: Conditional to log groups prefixed with "/aws/lambda/coupons*"
3. A Lambda function named **coupons_list** is registered in **localstack**.
4. The lambda function should be able to receive a sample event from API Gateway and return a sample response in JSON format, showing a message: { "message": "Coupons API is working successfully" }
5. The API is updated with the new endpoint available when GET requests are made to **"/coupons_poc"**.
6. A Unit Test is created to confirm that the function works as expected.
7. A Newman test is created in the **coupons_newman.json** collection to confirm that the API endpoint works as expected.

Submission:

1. Write down all the commands into a txt file and name it as "**Command.txt**"
2. Push your project folder into GitHub, including **output JSON**, **coupons_newman.json**, **unit test JSON**, and **your project files**.
3. Make a recording of running your project and show the outcome.
4. Submit the video into D2L dropbox and past your GitHub link into comment.
